

Challenge: Mental Block

Category: Cryptography

Points: 200

Description

Alright agents, settle in.

One of our operatives intercepted a strange sequence of numbers during a covert operation. He seems to be having a complete **mental** breakdown, stuck and unable to proceed. Before his comms went dark, he mentioned the initial encoding was a popular, non-standard one, often used for sharing digital wallet addresses. He also insisted that the key to the final layer of decryption was the very thing causing his state.

Can you get past the noise and decipher the original message?

Intercepted Data

102 89 81 119 78 55 68 122 120 117 78 86 49 77 75 110 106 82 67 117 114 56 73 122 54 116 88 102
101 53 56 121 87 67 83 122 79 116

Hint

The final cipher isn't a simple one-to-one substitution. The key is a single word from the description that describes our operative's state of mind.

Note: The flag is in the format `l8xieee{...}`.
